- App 2 - Tree Survey Schedules
- App 3 - Tree Protection Plan JSL1795_705
1 Executive Summary

1.1 RPS was commissioned by Hampshire County Council to prepare an Arboricultural Method Statement and accompanying Tree Protection Plan to support the planning submission for the development of land adjacent to Woodcroft Primary School, in Lovedean, Hampshire.

1.2 The Arboricultural Method Statement and Tree Protection Plan were produced following an Existing Amenity Vegetation Survey carried out by RPS in August 2011. All documents are in general accordance with the requirements set out in **BS5837: 2005 Trees in Relation to Construction – Recommendations**.

1.3 Havant Borough Council have confirmed that there are no Tree Preservation Orders currently in place on the site and that it is not within a conservation area.

1.4 A Tree Protection Plan JSL1795_705 (Appendix 3) has been prepared by RPS utilising the surveyed information compiled within the RPS tree survey.

1.5 The proposed development will necessitate the removal of a small number of recently planted tree groupings to the south and south-east of the site.

1.6 The proposed access off Woodcroft Lane will follow an existing track formed of hard standing which will be widened. This will impinge on the root protection areas and will extend beneath the canopy of a number of trees bounding the road. Appropriate measures shall need to be undertaken to reduce or mitigate the impact of these works.

1.7 Any tree works should to be in accordance with **BS 5837:2005 ‘Trees in Relation to Construction’** and **BS 3998:2010 ‘Recommendations for Tree Work’** (copies can be obtained from BSI Tel: 020 8996 7400 www.bsi.global.com) and The Arboricultural Association Guidance Note 8: Standard Conditions of Contract and Specification (2009) and ‘Recommendations for Tree Work’ BS 3998:2010 (copies can be obtained from the AA Tel: 01242522152, www.trees.org.uk).

1.8 All construction works within the RPA of any retained tree shall be completed with due regard to **APN 12 ‘Through the Trees to Development’** and **BS5837:2005 ‘Trees in relation to Construction’**.
2 Introduction

2.1 RPS was commissioned by Hampshire County Council to prepare an Arboricultural Method Statement and accompanying Tree Protection Plan to support the planning submission for the development of land adjacent to Woodcroft Primary School, in Lovedean, Hampshire.

2.1 The site is located and situated between Petersfield and Waterlooville in Hampshire and is adjacent to Woodcroft Primary School, a newly opened community school maintained by Hampshire County Council.

2.2 The purpose of this report is to detail the impact of the proposed re-development works on the existing tree stock across and directly bounding the site.

2.3 This report was informed by an Existing Amenity Vegetation Survey produced by RPS in August 2011.

2.4 The location of the trees were identified from a topographical survey (ref: E 793/2007/200) undertaken by Hampshire County Council in July 2007.

2.5 The Tree Protection Plan JSL1795_705 identifies the following:

- Trees to be retained;
- Trees to be removed;
- Alignment and design of protective fence;
- Root Protection Area (RPA) of trees;
- Methods of construction / implementation within RPA of retained existing trees

2.6 The Arboricultural Method Statement should be made available to all relevant site operatives prior to and throughout the demolition and construction process, so they understand the scope and importance of the tree protection measures.
### 3 Appraisal and Recommendations

**Appraisal**

3.1 The retained trees and hedges will need to be appropriately fenced and protected during construction phase. The retention and protection of the vegetation will also assist in assimilating the proposed development into the wider landscape and offer longer term tree cover.

3.2 The proposed development will necessitate the removal of a small number of recently planted tree groupings to the south and south-east of the site. The clearance of these tree groups should take into account the effect on the retained woodland edge in terms of health and safety and ensure that exposed edges are left wind-firm and safe.

3.3 The accommodation of the proposed main access entrance off the Woodcroft Lane on the north-east of the site will impinge on the root protection areas of T13 to T16 and extend beneath the canopy of the trees bounding the road. In these instances the proposed access will require the crown lifting of any low hanging tree canopies to offer a clear height of 4-5 metres and appropriate protection measures.

3.4 The proposed access off Woodcroft Lane will follow an existing track formed of hard standing which will be widened. It is reasonable to assume that the disposition of the roots will have been influenced by the presence of the hardstanding however care should be taken in their breaking out. To accurately assess level of root presence it is recommended that a series of hand dug trial holes or trenching along the line of the edge of kerb of the proposed access are undertaken.

3.5 To prevent soil compaction, the initial ‘breaking out’ of hard standings within the RPA shall be carried out by low impact hand held pneumatic tools. Removal of the hard surface should occur in strips working backwards from the undisturbed surface. This will limit encroachment onto existing soft ground and enable any exposed roots to be covered with a good quality top soil spread to avoid desiccation as the operation progresses. It will also avoid the need for excessive tracking and footfall on exposed ground. Subsequent removal of arisings and debris should be carried out by hand using the same route. Where roots are exposed for any period of time, they should be wrapped in damp hessian to protect them from drying out.

**Tree Works**

3.6 The low hanging canopies of trees are susceptible to damage during construction work. As such any required remedial tree works to the canopy should be undertaken in advance of any construction works to avoid undue damage to the canopy by plant / machinery etc. Tree works should maintain a natural shape and balance to the canopy of the tree.

3.7 When a branch is removed at its point of attachment, injury of the wood and bark of the parent stem or branch above the cut should be avoided. If a branch collar is visible, the final cut should be just outside it and care should be taken to avoid tearing retained wood and bark when the cut is made. Preliminary cuts should be made, if necessary, so as to remove weight, before a final cut is made. Care should be taken to prevent falling branches from harming other parts of the tree (including its roots), its surroundings, people or property. Heavy branches should be removed in sections and, where necessary, should be lowered with ropes.
3.8 All tree work should be carried out by a suitably tree qualified tree surgeon, preferably an Arboricultural Association approved contractor in accordance with Arboricultural Association Standard Conditions of Contract and Specifications for Tree Works (2008) Edition and BS 3998:2010 Tree Work.

3.9 Nesting birds are protected by law and any removal / tree works should not be carried out during the bird nesting season (March-August inclusive). Should any vegetation be outlined for removal during this period, then an ecological inspection would be required to check that no nesting birds are present. Should checks reveal nesting birds the vegetation must remain until September or until an ecologist has certified that the fledglings have left the nest. A visual inspection for bats shall also be carried on mature / ivy clad trees prior to commencing operations.

3.10 Prior to the commencement of any tree works an appropriate risk assessment should be produced to describe the measures required to fulfil the statutory safety obligations. It should aim to identify and prioritise the necessary control measures and precautions.

3.11 Following the works it is recommended that the trees are monitored on a regular basis to ensure their ongoing vitality and health. These inspections should be completed by a suitably qualified and experienced person. This should pay particular attention to the trees directly bounding the access off Woodcroft Lane.

**Tree Protection**

3.12 The RPA roughly equates to the spread of a tree canopy. This area or an area equivalent to a radius 12 times the stem diameter of the tree at 1.5m above ground level, whichever is the greater (capped at 15m), should be designated as the RPA. Where any part of a trees crown extends passed the calculated RPA, the protective measures should be extended to protect the trees branched framework. Where possible it should be fenced-off and protected in accordance with BS5837: 2005.

3.13 The tree protection measures shall be inspected and monitored during the course of the construction works, to ensure its compliance with the Tree Protection Plans JSL1795_705. The Client shall ensure that at regular intervals the protective measures are inspected to ensure that they are not damaged or been removed.

3.14 The Client or their nominated agent shall note areas which are not in accordance with the Tree Protection Plans; these areas shall be recorded and reinstated immediately. Where any areas of protective fencing cannot be reinstated for reasons unknown, consultation with an arboriculturalist should be sought immediately.

**Construction Methods**

3.15 Where paved construction and construction relating to the works is to take place within the RPA then certain measures need to be adopted to minimise disturbance or damage to the roots and to maintain ingress of water and air to the root zone.

3.16 These measures include:

- Carefully reducing levels by hand to avoid damage to the bark of larger roots which should be further protected from drying out whilst exposed;
The use of suitable no-fines granular sub-base and permeable wearing course materials, where possible, which do not interfere with air exchange to the roots for replacement fill or as a sub-base;

- The use of a load suspension layer, where possible, such as a three dimensional honeycomb system to minimise compaction;
- The use of proprietary load bearing tree soils which still allow oxygen and water to access the root system;
- The use of porous paving materials to allow air and moisture to penetrate to the rooting area;
- The use of ‘soft kerbs’ such as timber peg and board edging to reduce the require for excavation;
- Where practical existing wearing courses and sub-bases of existing hard surfaces should be used in proposed hard surfacing works, reducing the amount of required excavation; retain existing road surface levels where appropriate.

3.17 Where possible services should be routed outside the existing or potential root zone of trees. Where it is unavoidable, then hand excavation should be employed to avoid damage to the larger roots and the services slid through or below the root system. Ducting should be used to carry cables. Reference should be made to the recommendations included within NJUG 10 (1995 as amended).

| 09  | Works within the Root Protection Area (RPA) | Unavoidable root severance  
Adopt hand dig methods for reducing levels to avoid damage to roots. Where limited root pruning is unavoidable it should be made at a suitable place within the root system, avoiding damage to surrounding tissue. Final pruning cuts shall be made at right angles to the axis of the root. The final cut wound should be smooth and as small as possible, free from ragged torn ends  
Where root pruning is required to roots over 25mm in diameter, works should be overseen by a suitably qualified Arboriculturalist. Any root pruning should be completed in accordance with BS 3998:2010 | Arboricultural Association Standard Conditions Of Contract And Specifications For Tree Works (2008) Edition BS 3998:2010 Tree Work    | All tree work should be carried out by a suitably tree qualified tree surgeon, preferably an Arboricultural Association approved contractor. |
| 10  | Works within the Root Protection Area (RPA) | Fencing  
General garden fencing works should seek to minimise damage to tree roots and the tree canopy. Fencing should be aligned to avoid damage caused by fence post excavations, and to avoid unnecessary branch pruning. | BS 5837:2005 Trees in Relation to Construction: Section 11 RPS Tree Protection Plan JSL1795_705                                                                                             | RPS Tree Protection Plan JSL1795_705                                                                                     |

</table>
| G7           | Quercus robur, Corylus avellana, Ilex aquifolium, Acer campestre, Rosa canina  
Oak, Hazel, Dog Rose, Holly, Field Maple | >20 | - - - - | - | - | M | Fair/Good | Offsite group on steep backside. The group provides a significant buffer to the site and helps to enclose and define the southern boundary to Eagle Avenue. Large mature Oak dominate but large Ash is present, with Goat Willow suggesting that the condition may be locally wet in places. Generally the wood appear to have limited management and there are a number of fallen branches and tree typical of a wood of this age. Ensure that the trees on the site boundary are regularly monitored. |
| G8           | Salix caprea, Quercus robur, Corylus avellana  
Goat Willow, Oak, Hazel | >9 | - - - | Ave 0.18 | - | Y | Fair/Poor | Coppice group in grass intersected with small paths. Thin and remove dead trees. |
| G9           | Betula pendula, Quercus robur  
Birch, Oak | >10 | - - - | Ave 0.18 | - | Y | Fair/Good | Informal block of trees with a bramble understorey. |
| G10          | Carpinus betulus, Quercus robur, Corylus avellana  
Hornbeam, Oak, Hazel, Dog Rose, Holly, Field Maple | >9 | - - - | Ave 0.20 | - | Y | Fair/Good | Coppice group in grass intersected with small paths. Thin and remove dead trees. |
| G11          | Carpinus betulus, Fraxinus excelsior, Quercus robur, Betula pendula  
Hornbeam, Oak, Ash, Birch | >11 | - - - | Ave 0.22 | - | Y | Fair | Informal block of trees with a bramble understorey. |
| G12          | Quercus robur, Corylus avellana, Ilex aquifolium, Acer campestre, Rosa canina  
Oak, Hazel, Ash, Holly, Field Maple | >20 | - - - | - | - | M | Fair/Good | Offsite woodland provides a significant buffer and helps to enclose and define the site. Large mature Oak dominate. | G13          | Quercus robur, Corylus avellana, Ilex aquifolium, Acer campestre, Rosa canina  
Oak, Hazel, Dog Rose, Holly, Field Maple | >20 | - - - | - | - | M | Fair/Good | Offsite woodland provides a significant buffer and helps to enclose and define the site. Large mature Oak dominate. Generally the wood appear to have limited management and there are a number of fallen branches and tree typical of a wood of this age. Ensure that the trees on the site boundary are regularly monitored. |

RPS Planning Development

Note: This survey is based on a brief visual inspection from the ground. It is not intended as a full arboricultural inspection.
APPENDIX 3

Tree Protection Plan

JSL1795_705
Note: It has been assumed that the trees within the school grounds will not require protection. In the event of necessary construction within their vicinity, protection measures must be adopted.

F14 and the trees bounding the proposed access road may require detailed investigation.

Vegetation Here consists largely of overhanging materials – prune back to acceptable.
