Accident threshold for upper tier roads, which reflects expected levels associated with a road carrying a given level of traffic and an appropriate balance between safety and mobility, is 35 injury accidents per 100 million vehicle kilometres. The aim should be to align the local speed limit so that the original mean speed driven on the road is at or below the new posted speed limit for that road.

} - Sections linked together as one speed limit proposal

NOTES

- The accident data range used for the majority of links was 1 January 2005 to 31 December 2009
- Traffic flow data based on Annual Average Daily Traffic (AADT) and average 7day/24 Hour traffic flows.
- The route reference and road section relate to the individual sections of routes provided for reference purposes.
- Where traffic speed data has been obtained along individual sections of routes at multiple locations these have been averaged out.
